Hello all,

I am creating a series trailer which requires a subsequent image to go along with the video trailer. Is there any way that you can take an image still from the video (i.e. the "title" and export it as an image? Any help would be greatly appreciated as it would take a considerable amount of time to recreate this in Photoshop.

A number of video players allow you to take a "snap shot", you can paste this into a suitable photo file. You can open this with Photoshop if you need to work with it further.

Have you tried parking on the frame you want, hit F12 to go full screen, hit the "Print Screen" key and paste the clipboard into "Paint"?

You could also try inserting each frame that you want into an Edit and then exporting that Edit as an Image Sequence (i.e. PNG or JPEG).
