

Cant edit after Export

Posted by ShaunDillon - 06 Jan 2019 10:42

Hi

I am very new to Lightworks (free version 14.5). I am trying to make a timelapse movie from photographs. I had imported them as image-sequences to timeline and it was all good (but not finished fine-tuning). I then thought I would do an export to see how it looked.

But since I did the export I cant do any editing (mostly changing the speed of segments) If I right-click and choose 'Speed' nothing happens and the segmetns all look a bit greyed-out.

Can anyone help please?

Welcome to the forum.

I assume you're using the sequence timeline that you exported from, rather than the exported video itself.

Please could you provide the specification of your computer.

Hello,

Could it be that you simply disabled one or more track by clicking unintentionally onto the "All" button lower left hand side or on some track name? Those buttons toggle enable/disable tracks and have nothing to do with export.

Thanks! yes it was the All button - I figured it was something really simple like that 🙄

Thanks.
