

expand to dual screen in flexible mode?

Posted by kalimerox - 08 Jul 2019 06:57

is there a way to expand the gui to two displays?

I have 3 screens in the studio set up for my sound setup and would be great to use the whole screenspace for lightworks too...

thanks 🙏

You should be able to de-maximise the window and stretch it across multiple displays.

Hello,

If your OS is configured in a way that it allows expanding windows over multiple displays, you should be able to expand the Lightworks window over multiple displays.

To be able to resize the Lightworks window, disable 'Fullscreen window' from system settings.

Edit: Missed the post of Great Whit while typing.

thanks both,

yes this would work if both screens share the same resolution. in the studio thats cool, on my travel setup with laptop and external monitor it s not working well as both screens have different resolutions so there is no way to drag the lightworks session window in a useful way over both screens. but this is also a minor problem. ..
