

Can't import Bandicam footage into Lightworks

Posted by Sureitis - 20 Aug 2019 02:21

So I recorded some footage recently of my screen with Bandicam. I wanted to import the footage into Lightworks, which I was technically able to do, but the videos were blank once imported into the program. I deleted the videos from the project and attempted another time to import them. My second attempt was also unsuccessful.

I'm using version 14.5 (64bit) (110128) on Windows 10. I use an HP 15.6 Inch HD Notebook (2018) (8.00 GB ram) (standard disk drives). Processor: AMD A6-9225 RADEON R4, 5 COMPUTE CORES 2C + 3G 2.60 GHZ

I very much appreciate any help provided. Thank you.

You've got a non standard "target" frame rate

Frame rate : 3.813 FPS

You'll need to convert this to a standard frame rate before importing into Lightworks. Either Eyeframe or Handbrake should be able to do the job. There are some Handbrake settings in this sticky: www.lwks.com/index.php?option=com_kunena&func=view&catid=23&id=166802&Itemid=81

Okay, I already have Handbrake on my computer so I'll use that. Thanks!

I'd suggest using most recent Handbrake 1.2.2 with the preset "Production>>Standard" to convert the video. Make sure that "Frame rate(FPS):" from "Video" tab is set to 30 fps and NOT to "Same as source".

One side note:

Frame rate : 3.813 FPS

Minimum frame rate : 0.769 FPS

Maximum frame rate : 30.030 FPS
The extremely low detected frame rate could indicate that your computer was overloaded while recording. This can lead to serious recording dropouts, which are visible as choppy motion or, in extreme cases, as freeze frames. If you see something like this, you should change your game and/or recorder settings.
