

## White balance and RGB channel swap features

Posted by paocair - 10 Sep 2019 07:17

---

Hi to everyone. Two questions.

1) With lightworks can I custom white balance a video, using an eyedropper to make grey something that should be grey, and so turning the whole image?

2) Can I swap red and blue channels, to see blue in output for red in input, and red in output for blue in input?

Thank you.

Hello,

1) Use the Colour Correction effect. Under the tab 'Balance' you'll find three eyedroppers. If you've exposed a grey card properly, use 'Grey' and undo (Ctrl+Z or the symbol on the viewer) if something goes wrong.

There is a custom effect that allows you to swap channels arbitrarily, It's called &quot;Colour Swizzler&quot;, and will do exactly what you want. You will find it [here](#) . If you haven't installed a custom effect before you will find full instructions [here](#)

.
