

## System Clock Irregularity, how to fix clock sync

Posted by heisenberg2JZ - 16 Apr 2020 00:10

---

Hi, my situation is this, on another program, I needed to change the date, I moved my date forward on my computer (In Windows 10) five days, I must have changed the date back AFTER I installed and started using Lightworks,

I want to know now, how do I get Lightworks to run with the correct date on my computer? If I run the correct date I'm getting System Clock Irregularity and can not log in to run the program.

I've tried the trick with deleting the two folders (G0001000, and P0001000) with no luck, so now I'm running with my date five days ahead, which will conflict with everyday functions at some point, but is currently the only way to use this software.

Once I'm done with the current project, my idea was to wipe the program completely and reinstall fresh, with the correct date as my starting point, but I have quite a ways to go before I'm finished on this one.

Any advice on how to fix would be great, thank you

=====

## SOLVED! System Clock Irregularity, how to fix clock sync

This problem is solved, the System Clock Irregularity was directly tied to my current project files. Once the project was fandangled and finished, I wiped every trace of Lightworks off my machine, and reinstalled, ready for the next project. Upon fresh startup I can gladly say I have no more System Clock Irregularity! Hopefully this helps anyone in the future, just know that you can't switch up your system date/time while working on something, or maybe at all, I only had changed mine because I was being shady in a video game that used real world time, I had also installed and started on a project while my time was spoofed, and the rest is history.

Glad to hear that you've found a way of escaping from this trap.

Thanks for all the ongoing feedback.

You should mark this thread as solved, heisenberg2JZ. You can do that by editing your first post and adding the word [SOLVED] to the title.
