

Freezing when trying to apply Boris FX

Posted by Danielo123 - 30 May 2020 14:02

I tried to apply stabilizer effect as explained [here](#) onto a video and the result was horribly cropped.

I then tried to apply the effect on a smaller section, and when I pressed on 'launch' lightworks froze. I restarted the computer and tried again - and it froze again.

Any help will be appreciated

Update: I have two screens, and was working only on one. When I changed the projection to extend the view to both screens I found that the Boris did open on the other screen, and so was able to apply the filter.

To my great disappointment, the video has been a little bit cropped but not stabilized.
