

Transcoding and Third Party Options

Posted by Klassix2814 - 05 Feb 2021 02:37

Hey y'all.

I'm wondering if anyone knows the best way to convert h.264 files to more edit friendly codecs on the Linux version? I remember back when I was using Windows that Cliptoolz Convert was a great option for that, and sadly it doesn't have any Linux support.

I suppose another question would be what file types / codecs work best with Lightworks generally speaking?

How does using a server type processor in combination with an NVidia GPU negatively affect the performance of the GPU?

I suspect that's a question only NVidia or Intel engineers can answer.

I'd be happy to take part in that performance test once I get some significant time to dedicate to it.

I appreciate it. Looking forward to seeing your results.

That should take less than 15 minutes. 😊
