

## My video player doesn't work properly.

Posted by Etzomat - 15 Jan 2014 20:18

---

Hello forums!

I just started editing with Lightworks and I have watched a few tutorials for some basic knowledge, but I still have this problem with my player.

When I double click on either my edit or my file at a bin, the player opens up and shows me the very first frame of the whole video. When I press play I can clearly hear the audio, but the video refuses to do anything.

Moreover my video-track seems to be longer than the audio-track (talking about the same clip here), which is impossible, since I record both with Fraps.

I hope some of you can help me with this issue, since I'm looking forward to start editing ☺

Recording with Fraps might be the problem. Fraps uses usually a variable Framerate. try to use Eyeframe convertor to try to get the framerate rigid.

for more informations, search for Variable framerate or Fraps in this Forum.

Thanks for the quick answer. As soon as I got some spare time I will try it and get back here to tell you if it worked! ☺

Since this thread refers to an earlier version of Lightworks. I'm going to lock it.

V14.5 can import variable frame rate media, so the advice is out of date.
