

## **BUG? need help with quality of videos from hypercam**

Posted by Ellx - 23 Jan 2015 16:58

---

Plus the audio doesn't sync up well.

Anyone else have this problem with hypercam footage in lightworks?

is there a solution?

If you have an answer please do it in video form explaining and showing how to fix.

Thank you

You can't be awesome unless you are doing it at 60 fps. Just so you know.

I would have thought 120fps at the least in 360 degree VR format - Cinerama eat your heart out.

From my quick look at the HyperCam I've downloaded it's the simplest and most user friendly of the bunch - still installed after 5 hours is a world record here.

Seriously though all a user has to do is preferably capture in their final output frame size unless that is too silly but at least use one of the following frame sizes

720x486 NTSC

720x576 PAL

1280x720 HD

1920x1080 HD

2048x1080 2K

2048x1556 2K

4096x3072 4K

The great survivor, HyperCam that is, allow one to drag a frame size and shows what it is numerically as the drag is happening. How easy can it get?

EDIT: --- and just because I could - I exported a 60fps 720x576 .avi file from HyperCam - no problem - that imports into LW immediately - haven't been able to play it too well on this office configuration LW.
