

Is it possible to have Lightworks work with Intel graphics card?

Posted by TheEnigmaticSoul5 - 30 Aug 2015 23:31

These are my specs:

MacBook Pro (Retina, 15-inch, Mid 2015)

2.5 GHz Intel Core i7

16 GB 1600 MHz DDR3

Intel Iris Pro 1536 MB

The video plays at normal speed during editing. But the sound is slow while editing. Is it possible to make this problem go away? Please?

In the Windows environment, Intel graphics cards are not supported. Due to the different Mac architecture this may not be a problem for you. You may actually have a media problem. This sounds more like a variable framerate issue to me.

Where does your media come from? We need much more info about it to help you. Could you please download [MediaInfo](#) and post the report that it produces on one of your "bad" media files here. Then we'll have a better idea of what to suggest.

No, I mean that when I'm editing in Lightworks the video and sound are out of sync. The video edit preview plays at normal speed, but the sound is super slooooooowww.....

Running the Mediainfo analysis will enable other users to see the details of the media you're trying to edit and see if that may be causing the slow audio. At the moment we know nothing about it.
